

Company Overview

Northwind Robotics was founded in 2017 in Tallinn, Estonia. The company builds autonomous warehouse robots and employs 240 people across three offices. Its flagship product line is the Atlas series of picking robots.

The company operates on a four-day work week and is employee-owned.

Vacation Policy

All full-time employees receive 27 days of paid vacation per year, in addition to public holidays. Unused vacation days can be carried over into the first quarter of the following year, up to a maximum of 5 days.

Vacation requests longer than two consecutive weeks require approval from a department head.

Security Practices

All employees must use hardware security keys for authentication to production systems. Passwords alone are never sufficient for access to customer data.

Security incidents must be reported to the on-call security engineer within 30 minutes of discovery.

Remote Work

Employees working remotely receive a one-time home office stipend of \$1,200 to purchase equipment. The stipend renews every three years.

Remote employees must be reachable during core hours, defined as 10:00 to 15:00 in the Tallinn time zone.

On-Call Rotation

The engineering on-call rotation lasts one week and includes a compensation bonus of 8% of weekly salary. Engineers may swap rotations with at least 48 hours notice.

Escalations that remain unresolved for more than one hour are paged to the engineering director.
